Background

Medical imaging can be confusing before, during, and after an appointment. ScanBridge is designed to make practical next steps easier to find without making medical decisions for patients.

Intervention

ScanBridge combines patient-friendly scan guides, a Lebanon imaging-center directory, an emergency preparation card, bilingual support, and Milo, a safety-bounded chat assistant.

Planned pilot method

Recruit 10-15 testers. Each person completes one practical task, then shares anonymous usability feedback about clarity, confidence, and what should improve.

Motivation

The project began after a frightening drive in which a family could not quickly work out where to go for help. That uncertainty inspired a safer, clearer navigation tool.

Safety boundaries

ScanBridge does not diagnose, interpret images or reports, prescribe treatment, or replace doctors or emergency services. Its purpose is education and navigation.

Privacy

The pilot does not request names, medical reports, symptoms, or other private health information. Findings will be published only as anonymous aggregate results.

STATUS: PILOT RECRUITMENT OPEN

Results are pending. This poster reports verified baseline work, not participant outcomes.

Next steps: collect feedback, publish aggregate findings, improve the product, and invite school, clinic, and medical reviewers.
